MISART
MISART Integrated Modelling for an Environmental, Rural and Tourism System.
Aimed at creating a model for the sustainable management of farms. This model was developed at a general level and applied to a specific area: Quinta da França, in Cova da Beira. The results are widely transferable. The general model is applicable to any case of sustainable rural development and, in some components, for any environmental problem. Specific solutions are generally applied in rural areas, in some cases with particular incidence in the Mediterranean area.
